

# Integrating Scientific and Local Data

## Enhancing Streamflow Predictions At Local Scale With Hybrid Modelling

**Yiheng Du, Ilias Pechlivanidis**

Swedish Meteorological and Hydrological Institute

# Challenge –Hydrological Modelling at Local Scale

**Intensified extreme events**  
*IPCC Sixth Assessment Report*  
has noted increase of different  
extreme events, with high  
confidence level.

Heatwave, heavy precipitation,  
river flood, drought, compound  
extremes.

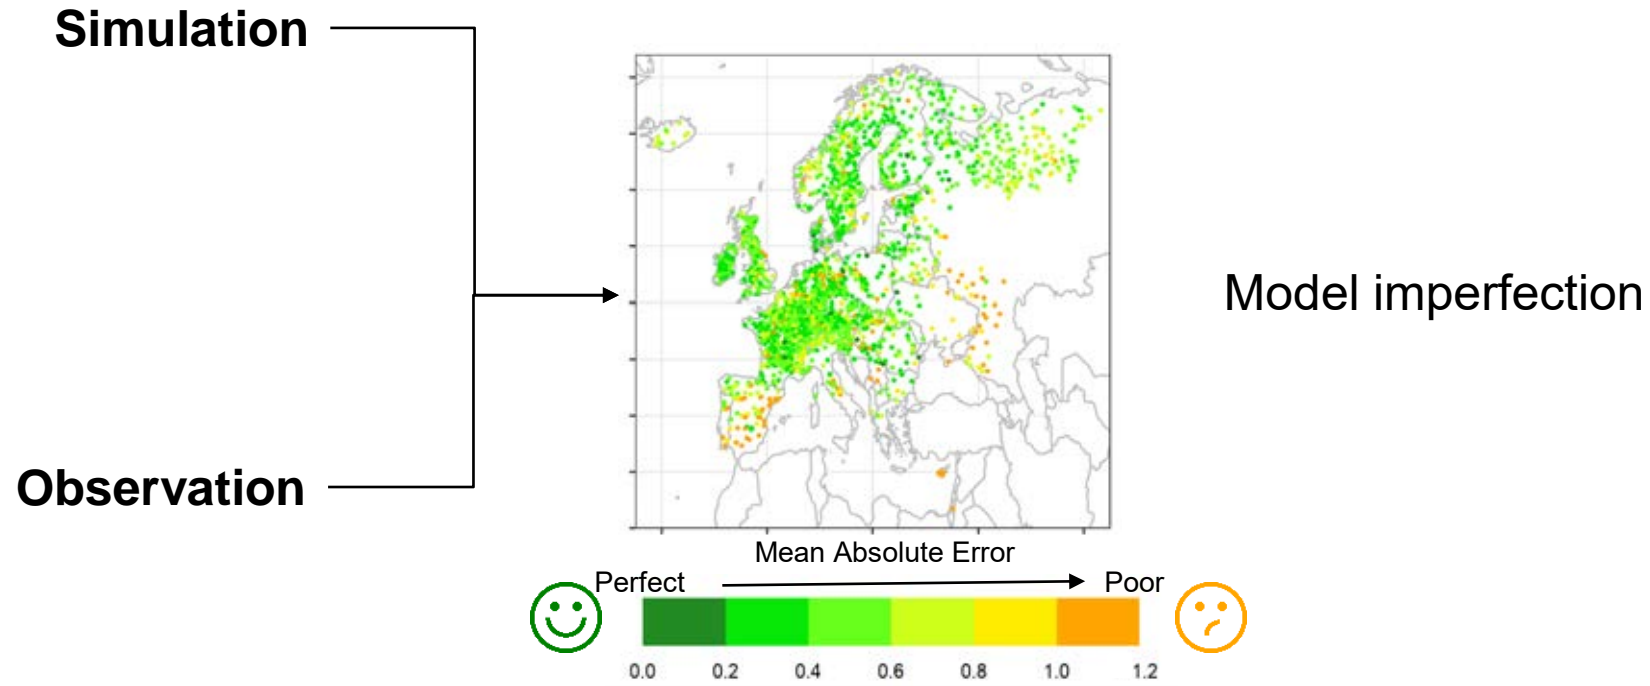

**Population Growth  
and Urbanization**  
More than 4 billion  
people – more than half  
of the world – live in  
urban areas.  
Two third by 2050

Concentrated  
population,  
infrastructure, water  
demand

**Preparedness**  
Include:  
Accurate forecasts of  
the hazards

# Challenge –Hydrological Modelling at Local Scale

---

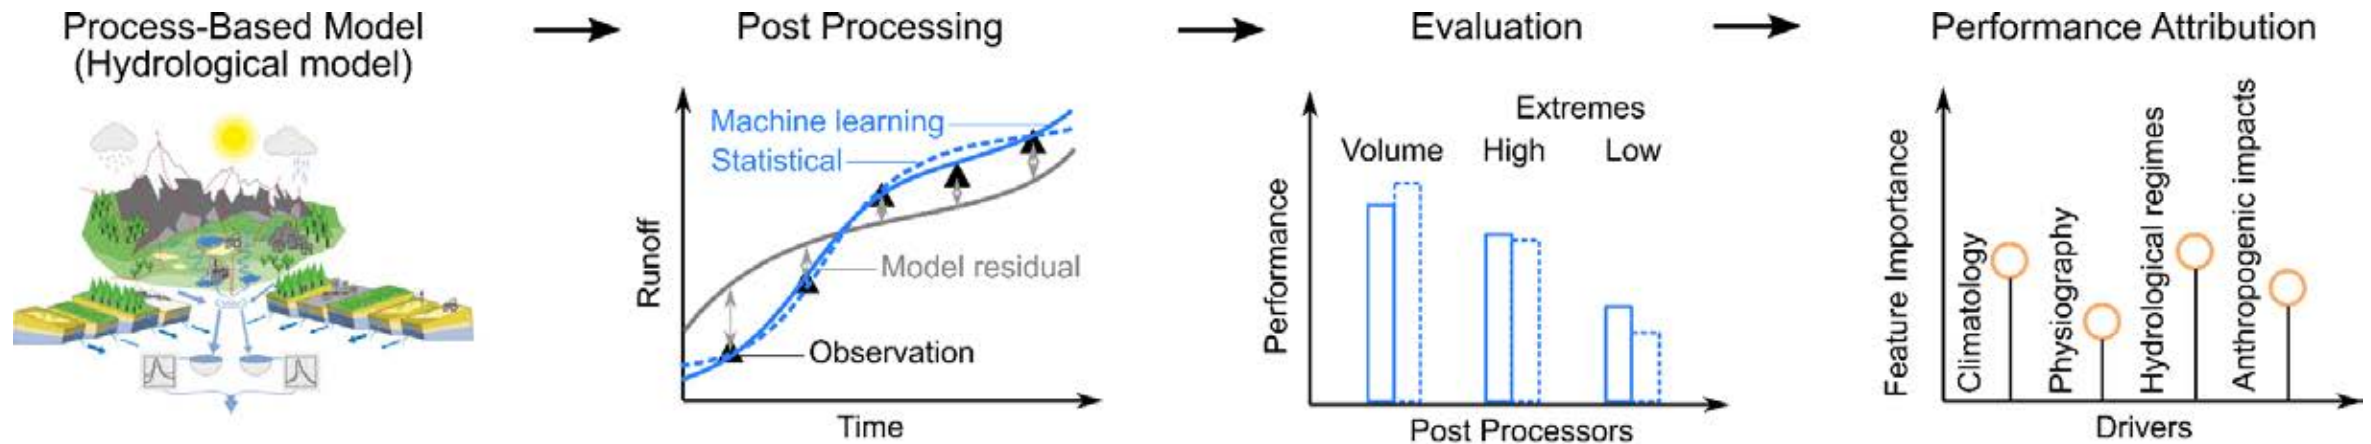

## Challenge –Hydrological Modelling at Local Scale

---

- Uncertainties and errors in model setup and parameter identification
- hydro-climatic gradient
- Anthropogenic influence

# Solution – Hybrid Framework at Gauged Basins

Observed and modelled data

- Inputs: Simulated streamflow
- Outputs: Observed streamflow
- OR
- Residuals

Post-processing to local data

- Generalized Linear Model (**GLM**)
- Quantile Mapping (**QM**)
- Random Forest (**RF**)
- Long Short-Term Memory (**LSTM**)

Evaluation and causation

- Compare performance
- Identify patterns and drivers

Individually Trained  
80% Training  
**20% Testing**

# Performance – Hybrid Framework at Gauged Basins

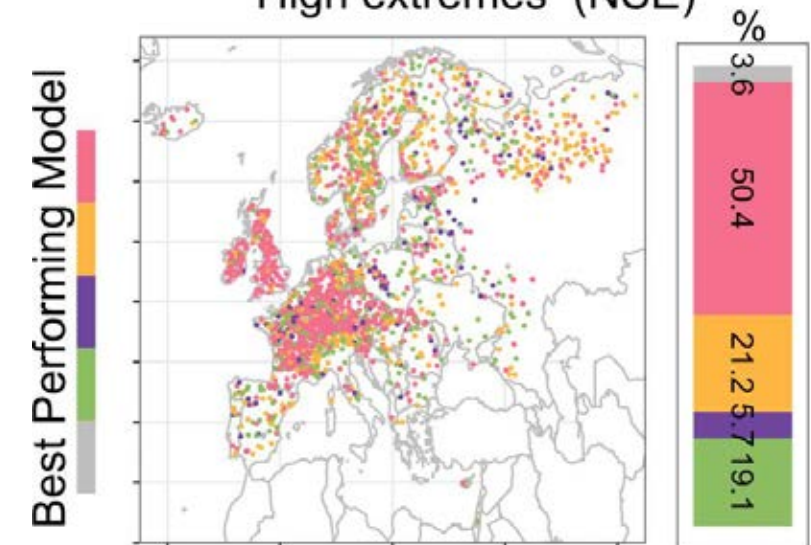

Overall

High extremes  
NSE

Spatially

High extremes (NSE)

**High extremes:**  
NSE  
Nash-Sutcliffe coefficient

**Low extremes:**  
logNSE  
Logarithmic NSE

**Total volume:**  
SMAE  
Scaled Mean Absolute Error

Hybrid modelling improves representation of streamflow characteristics at local scale

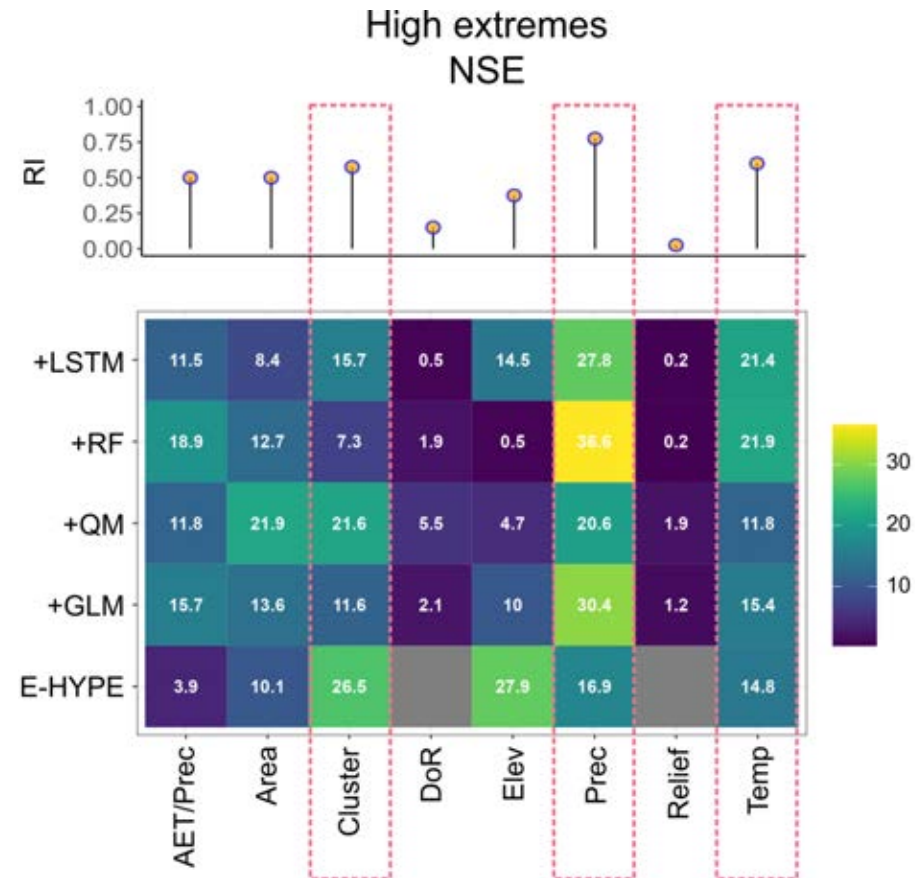

# Understanding – Hybrid Framework at Gauged Basins

Potential drivers:

- Climatology
- Topography
- Human impact
- Hydrological regimes (Cluster)

**CART**

**Classification and Regression Trees**

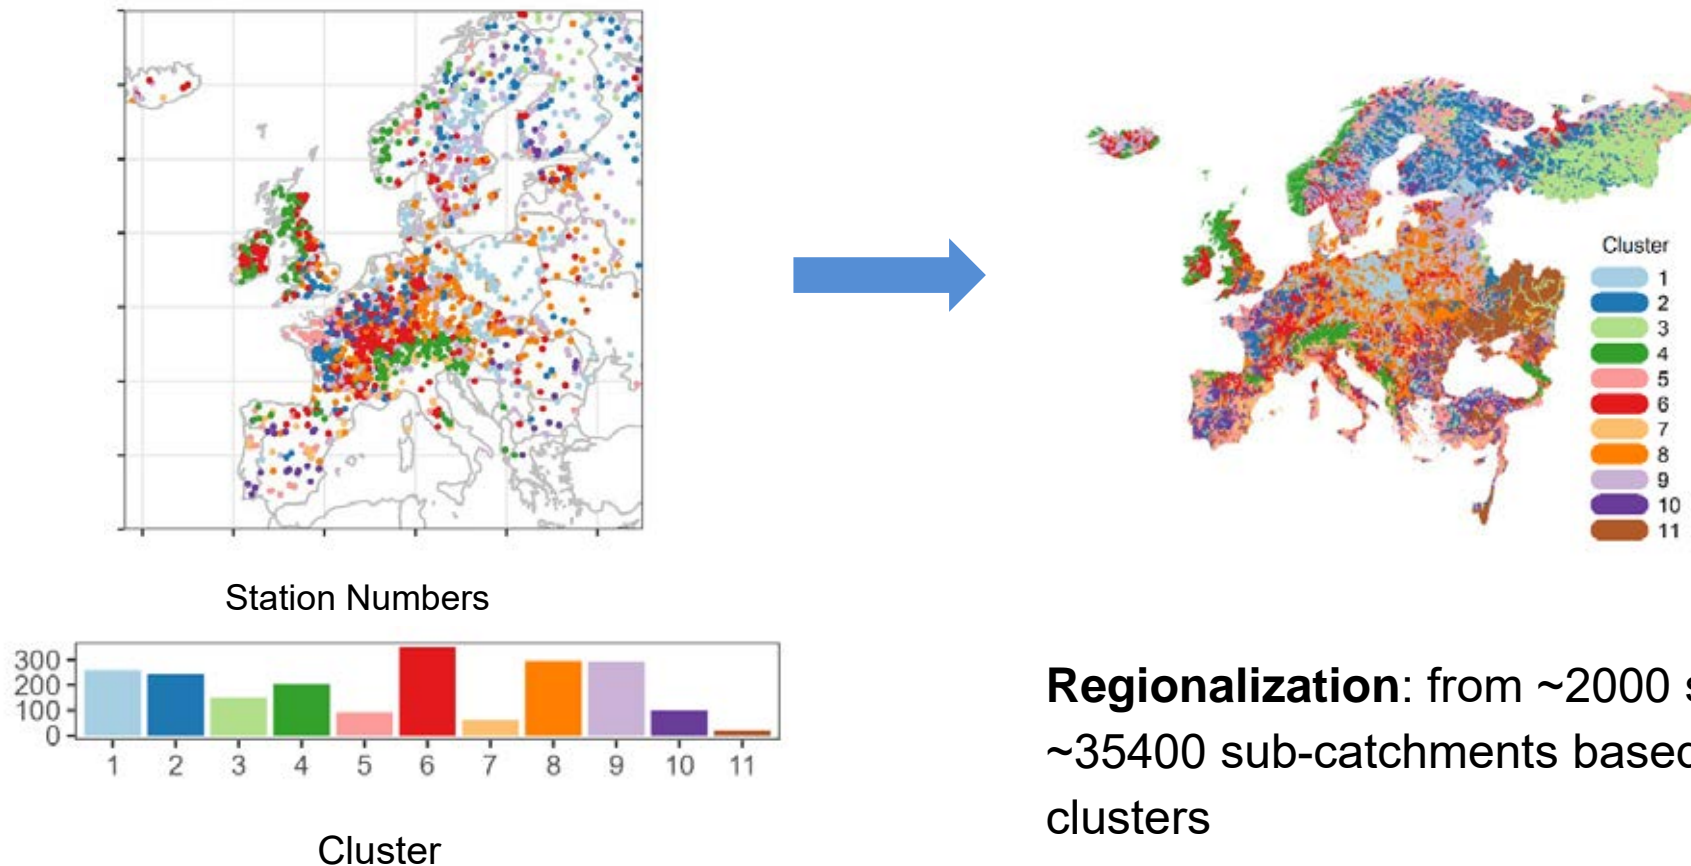

(Du and Pechlivanidis, 2025)

# Solution – Hybrid Framework at Ungauged Basins

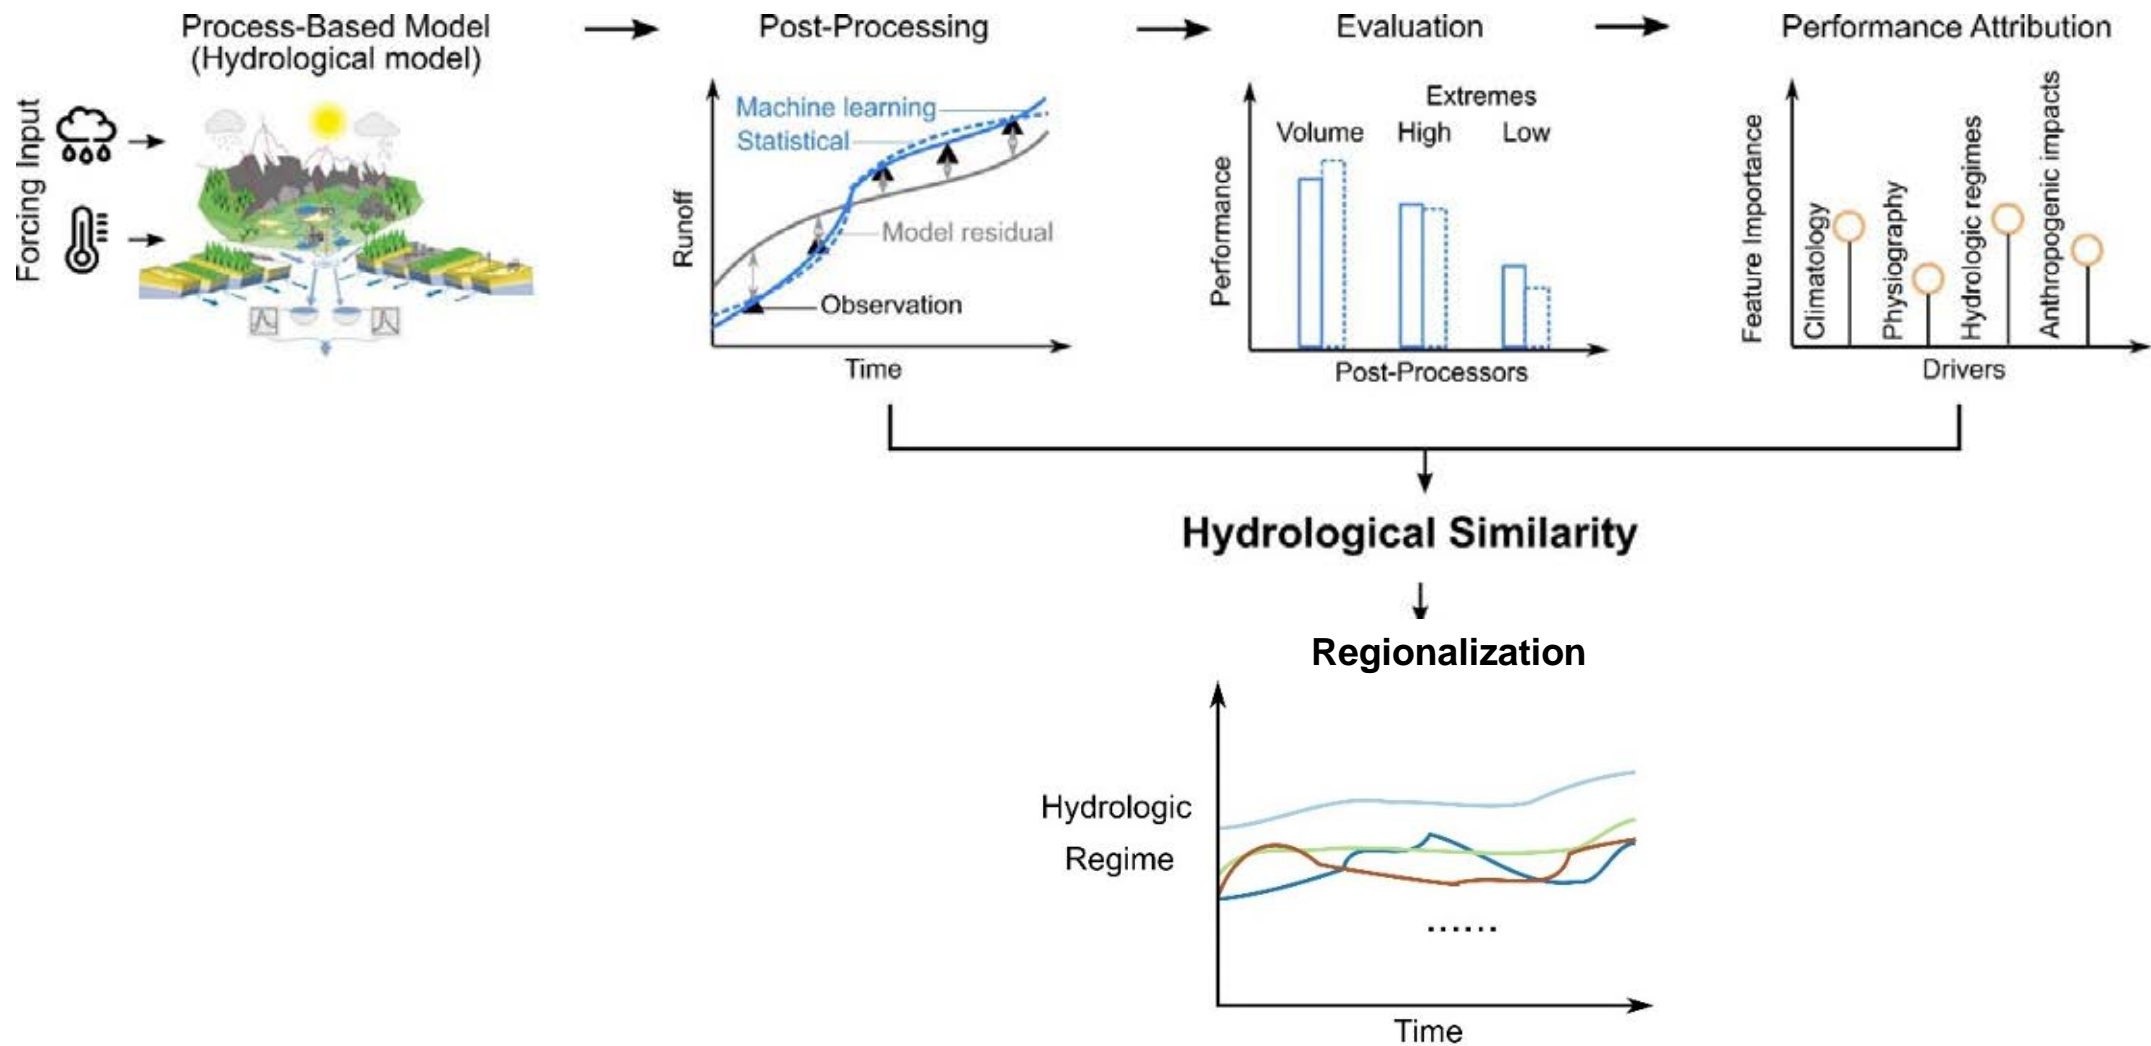

## Regionalization - Hydrological similarity

**Regionalization:** from ~2000 stations to ~35400 sub-catchments based on clusters

# Solution – Hybrid Framework at Ungauged Basins

# Application – Hybrid Framework in Operational Forecast

# Take home messages

---

- **Large-scale hydrological models** are important tools to support equitable access to climate services.
- However, they often face challenges **at the local scale**, where critical decisions are made.
- **A hybrid framework** that integrates post-processing techniques can improve their performance.
- **A regionalized approach** can even enhance predictions in ungauged basins by using information from gauged ones.
- These methods show strong potential to be **operationalized** in climate and hydrological forecast products.
